

The Claude Web Design "Cheat Sheet"

From Basic Layouts to Production-Ready Sites

Most people think Claude is just a chatbot, but they're using it the old way. You're about to turn it into a full-scale web design agency by installing the right **Skills**.

Here is the exact list of commands and skills to upgrade Claude from "average" to "Senior UI Designer."

1. The Core Setup: Claude Code

To use these "Skills," you need to be running **Claude Code** (the terminal version of Claude). This is where the real power lives because it can actually interact with your computer and your files.

2. The "Better UI" Skill (Design Quality)

Most AI-generated sites look the same: purple gradients and generic cards. This skill fixes that by giving Claude a "design philosophy" before it starts coding.

- **The Command:** `npx skills add anthropics/claude-code-skill-frontend-design`
 - **What it does:** It teaches Claude about visual hierarchy, bold typography, and modern color palettes. It stops Claude from making "AI-looking" sites and starts making things that look like a human designer reviewed them.
-

3. The "Animation Library" Skill (Motion)

If you want your site to feel alive with high-end animations (like Framer Motion or GSAP), you need this specific skill.

- **The Command:** `npx skillfish add itsimonfredlingjack/codex-dev-plugin animation-libraries`
 - **What it does:** It gives Claude expert knowledge on high-performance motion, scroll-linked animations, and page transitions. It turns a static page into a dynamic experience.
-

4. The "Web Design Architecture" Skill (Structure)

This is the skill that ensures your site isn't just pretty—it's functional and responsive.

- **The Command:** `npx skillfish add aviflombaum/claude-code-in-avinyc web-design`
 - **What it does:** It turns Claude into a UI/UX lead. It focuses on mobile-first architecture, WCAG accessibility (making sure the site works for everyone), and Tailwind CSS best practices.
-

5. Your "Production-Ready" Workflow

1. **Install the Skills:** Run the commands above in your terminal.
2. **Define the Goal:** Instead of a generic prompt, say:

"/frontend-design build a landing page for a luxury watch brand. Use the /animation-libraries to add smooth entry transitions."

3. **Iterate:** Use the command `/simplify` or `/debug` if you need to clean up the code.
-

The secret isn't asking Claude to "draw" a site—it's giving it the professional skills to build one.
